

Project Design Phase Solution Architecture

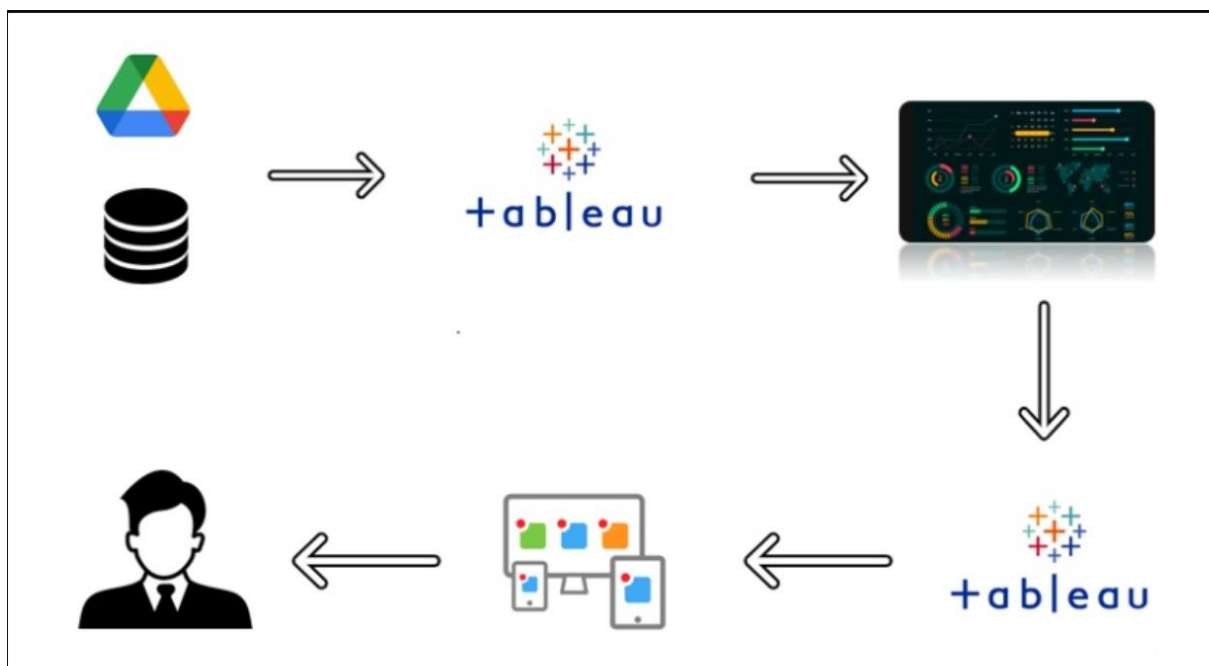

Date	05-07-2026
Team ID	SWTID-2026-8108
Project Name	Heart Disease Analysis
Maximum Marks	

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

This architecture diagram illustrates the end-to-end data flow of our Heart Disease Risk Factors Analysis project. Using a native connector, this data is piped directly into Tableau, which serves as our core data processing and analytics framework. Here, calculated fields and aggregates are computed to build an interactive, multi-perspective Visual Dashboard. The storyboards are then published locally using the Tableau Desktop interface, allowing cross-filtering across 4,416 rows of data to be served cleanly on desktop screens and mobile interfaces. This loop concludes with the End Users—such as Dr. Sharma, Ramesh, or individual patients—who can immediately extract actionable healthcare insights through intuitive, 1-click visual charts.
