Customer Problem :

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1: The Clinician's Perspective (Dr. Sharma)	A senior cardiologist working at a busy metropolitan hospital.	Segment middle-aged patients by clinical metrics like BMI, age, and smoking habits to design targeted preventive campaigns.	It is difficult to instantly isolate high-risk groups or see how complex clinical risk factors overlap using raw patient logs.	The clinical metrics are trapped in dense relational database structures without an interactive visual layer.	Restricted and concerned that critical high-risk patient trends are staying hidden until severe medical outcomes occur.
PS-2: The Policymaker's Perspective (Ramesh)	A data analyst working with a government public health department	Study trends in heart disease prevalence across urban and rural demographics to develop structural preventive health policies.	Cross-examining large-scale health data manually takes too much time and makes it hard to present actionable insights to decision-makers.	The department lacks integrated, scannable dashboards that clearly map lifestyle indicators against disease rates.	Ineffective and overwhelmed trying to back up important health policies without clear visual evidence

PS-3: The Individual's Perspective (Anita)	A 45-year-old professional with a strong family history of heart disease.	Monitor my personal health risk factors and make proactive, informed lifestyle choices to stay healthy.	I cannot easily see where my personal metrics stand compared to healthy benchmarks or what specific actions to take.	I do not have access to simplified, interactive tracking charts provided by my healthcare provider.	Anxious and uncertain about how to effectively reduce my long-term cardiovascular risks.
